

In Arya School at rajgurunagar we prepare three beds of different dimensions. On the beds we sprayed the BARC culture for proper decomposition of wet waste. We composted 800 kg of waste daily and we composted 8 tonnes of wet waste in 1 month.

Problems

1. Garbage coming for decomposition was not properly separated; it contains plastic, metals and some coconut shells.
2. To maintain the humidity of the bed it requires water but near the location there is a lack of water.
3. Workers are not available for work.

Suggestion

After making this type of bed the problem of flies, leaching and smell gets solved.

We suggest rajgurunagar perished for composting garbage of 2000 households.
